APPENDIX 1 7
Executive Summary

New Zealand Type Acceptance has been granted to the Bell Model 505 based on validation of Transport Canada Type Certificate number H-112. There are no special requirements for import.

Applicability is currently limited to the Models and/ or serial numbers detailed in Appendix 1, which are now eligible for the issue of an Airworthiness Certificate in the Standard Category in accordance with NZCAR §21.191, subject to any outstanding New Zealand operational requirements being met. (See Section 5 of this report for a review of compliance of the basic type design with the operating Rules.) Additional variants or serial numbers approved under the foreign type certificate can become type accepted after supply of the applicable documentation, in accordance with the provisions of NZCAR §21.43(c).

NOTE: The information in this report was correct as at the date of issue. The report is generally only updated when an application is received to revise the Type Acceptance Certificate. For details on the current type certificate holder and any specific technical data, refer to the latest revision of the State-of-Design Type Certificate Data Sheet referenced herein.

1. Introduction

This report details the basis on which Type Acceptance Certificate No. 17/21B/11 was granted in the Standard Category in accordance with NZCAR Part 21 Subpart B.

Specifically the report aims to:

(a) Specify the foreign type certificate and associated airworthiness design standard used for type acceptance of the model(s) in New Zealand; and

(b) Identify any special conditions for import applicable to any model(s) covered by the Type Acceptance Certificate; and

(c) Identify any additional requirements which must be complied with prior to the issue of a NZ Airworthiness Certificate or for any subsequent operations.
2. Aircraft Certification Details

(a) State-of-Design Type and Production Certificates:

- Manufacturer: Bell Helicopter Textron Canada Limited
- Type Certificate: H-112
- Issued by: Transport Canada
- Production Approval: Certificate of Approval 1-86

(b) Models Covered by the Part 21B Type Acceptance Certificate:

(i) Model: 505
- MCTOW: 1669.2 kg [3680 lb.]
- Max. No. of Seats: 5
- Engine: Safran Arrius 2R
- Type Certificate: E.031
- Issued by: European Aviation Safety Agency
3. Application Details and Background Information

The application for New Zealand type acceptance of the Bell Model 505 was from the type certificate holder, dated 10 January 2017. The first-of-type example is scheduled for delivery in the third quarter of 2017. The Bell 505 is a five-seat single turbine powered light helicopter with a semi-rigid underslung tettering rotor system.

Type Acceptance Certificate No. 17/21B/11 was granted on 23 June 2017 to the Bell 505 based on validation of Transport Canada Type Certificate H-112. Specific applicability is limited to the coverage provided by the operating documentation supplied. There are no special requirements for import into New Zealand.

The Bell 505 helicopter is a new design developed using as much as possible of the Model 206L-4 dynamic components, including the 2-bladed main and tail rotor hubs and blades, main transmission, tail rotor gearbox and drive shafts, combined with a new fuselage. The latter uses mostly conventional metallic materials with some composite materials for the mid and aft-skins, nose cone, cabin roof sandwich panel, and sidebody primary structure. A welded steel tubular structure (truss) is used for the aft fuselage. Power is from a single Arrius 2R turbine engine using dual FADEC with automatic back-up controller. The 505 has a fully integrated glass cockpit based on the Model 407GX Garmin G1000H system, in this case using a single G1A 63H avionics unit with single channel electrical architecture.

Supplemental Type Certificates
The certification basis under the State-of-Design Transport Canada Type Certificate H-112 and the FAA Type Certificate R.00008RD are essentially the same. Bell has confirmed that the approved type design is identical under both type certificates. Therefore in accordance with CAR §21.503(a) FAA STC’s approved for the Bell 505 are acceptable technical data for embodiment on New Zealand registered Bell 505 aircraft.
4. NZCAR §21.43 Data Requirements

The type data requirements of NZCAR Part 21B Para §21.43 have been satisfied by supply of the following documents, or were already held by the CAA:

(1) State-of-Design Type certificate:
   Transport Canada Type Certificate Number H-112
   TC Type Certificate Data Sheet number H-112 at Issue 1 dated December 19, 2016
   - Model 505 approved December 19, 2016

(2) Airworthiness design requirements:
   (i) Airworthiness Design Standards
       The certification basis of the Model 505 is Transport Canada Airworthiness Manual (AWM) Chapter 527 Normal Category Rotorcraft at Change 527-11 published July 31, 2014 (equivalent to FAR Part 27 Amendment 27-0 through 27-47). This is an acceptable certification basis in accordance with NZCAR Part 21B Para §21.41, as FAR 27 is the basic standard for Normal Category Rotorcraft called up under Part 21 Appendix C. One Special Condition was applied and three Findings of Equivalent Safety were made. These were reviewed and accepted by the CAA. There are no non-compliances and no additional special conditions have been prescribed by the Director under §21.23.

   (ii) Special Conditions
       SCA 2015-09 Rechargeable Lithium Batteries – TC Issue Paper L-02 – The Model 505 uses a lithium-ion main battery and also as a back-up battery in the standby instrument. Because of their characteristics and history Transport Canada set additional airworthiness requirements; including safe cell temperatures and pressures must be maintained during any probable overcharging or overdischarging; no emission of any toxic or explosive gases; retention of any corrosive fluids or gases; automatic control of the charging rate; battery sensing and warning systems; and specific maintenance and inspections criteria in the ICA. Interpretative material and MOC is contained in Appendix A, based on AC20-184. Compliance was demonstrated using DO-311 and DO-347 testing.

   (iii) Equivalent Level of Safety Findings
       AWM §527.307(b)(5), §527.723, §527.725, §527.727 Landing Gear Limit Drop Test – TC Issue Paper S-01 – Bell has had analytical methods to model landing gear behaviour validated as an acceptable means of compliance for simple skid type gear in lieu of drop tests.

       AWM §527.1545(b)(2) Airspeed Indicator Markings of VNE (Autorotation) – TC Issue Paper F-01 – The power off VNE is not displayed as a red cross-hatch, as prescribed in the Rule. Bell contended an electronic display offers advantages in presentation and readability, and can also be calculated based on temperature and pressure without the pilot needing to refer to a chart. Equivalence was accepted based on a display which is intuitive and easy-to-read in all conditions, and is an improvement over conventional mechanical gauges.

       AWM §527.995(d) Fuel Shut-off Valve Installation – TC Issue Paper M-08 – The Fuel SoV is mounted on the forward firewall but the outlet section protrudes through, which does not strictly comply with AWM §27.995(d). Bell demonstrated equivalent functionality of the SoV in the case of an engine fire through a fireproof test using the guidance material of FAA AC 20-135.

   (iv) Airworthiness Limitations
       See Chapter 4, Airworthiness Limitations Section of BHT-505-MPI-1
(3) Aircraft Noise and Engine Emission Standards:

(i) Environmental Standard
Compliance for the Model 505 has been shown against AWM Chapter 516, at Change 516-10; Subchapter A for Aircraft Noise (this refers to ICAO Annex 16, Volume I [this also covers FAR Part 36, including Amendment 36-30]), and Subchapter B for Prevention of Vented Fuel (this refers to ICAO Annex 16, Volume II, Part II).

(ii) Compliance Listing
Bell Report SLS-993-007R – Noise Certification Compliance of the Model 505 Helicopter – Rev.A (See also RFM Section 4.10 Noise Levels.)

5. New Zealand Operational Rule Compliance

Compliance with the retrospective airworthiness requirements of NZCAR Part 26 has been assessed as they are a prerequisite for the grant of an airworthiness certificate.

Civil Aviation Rules Part 26

NOTES: 1. A Design Rule reference in the Means of Compliance column indicates the Design Rule was directly equivalent to the CAR requirement, and compliance is achieved for the basic aircraft type design by certification against the original Design Rule.

2. The CAR Compliance Tables above were correct at the time of issue of the Type Acceptance Report. The Rules may have changed since that date and should be checked individually.

3. Some means of compliance above are specific to a particular model/ configuration. Compliance with Part 91/ 119 operating requirements should be checked in each case, particularly oxygen system capacity and emergency equipment.
