Note that relevant traffic information will be issued whenever ATC is aware of conflicting aircraft if separation is not required. It's your job to sight that traffic (if necessary) and maintain a safe distance.

Conditional Line-up

Tower: Fastair 354 report the blue Dash 8 on final in sight.

Fastair 354: Blue Dash 8 in sight.

Tower: Fastair 354 behind the landing Dash 8 on short final line up behind.

Fastair 354: Behind the landing Dash 8, line up behind, Fastair 354.

If the preceding aircraft causing the condition is on final, a conditional line-up instruction will contain the key word BEHIND at the beginning and end of the instruction.

If the preceding aircraft is occupying the runway, or taxiing in front of the aircraft receiving the clearance, the controller will use the word AFTER, instead of BEHIND, in a conditional line-up instruction.

It's worth noting that the controller will only issue a conditional line-up clearance if they consider that the aircraft receiving the clearance can see the aircraft causing the condition.

Helicopter Departure Investigation

The CAA conducted a theme investigation to analyse the reasons for helicopter takeoffs without a clearance. A theme investigation tries to identify common themes in a set of aviation accidents and incidents.

The analysis revealed three locations where 61 per cent of incidents predominantly occurred involving helicopter takeoffs without a clearance. They were Nelson, Hamilton, and Palmerston North.

Matt Harris, CAA Safety Investigator, explains that the potential consequences of a departure without a takeoff clearance is classed as 'high risk'.

"At those three aerodromes, there's a large amount of commercial traffic, and that raises the risk. We determined that the helicopter occurrence rate is approximately seven times higher than the fixed wing rate at the same three aerodromes," says Matt.

Alternative Process for **Determining Cardiovascular Health**

The CAA has adopted an alternative process for determining cardiovascular health which, for many participants, may cost less. The new process may not be the best option for everyone, however.

"

e've recently reviewed cardiac imaging methodologies and accept that CT coronary artery calcium scoring (CT calcium scoring) is a useful way of assessing cardiovascular risk," says Dougal Watson, CAA's Principal Medical Officer.

The calcium test will only be applied to participants who are judged to have an elevated cardiovascular risk. There are many factors that determine cardiovascular risk including age, blood pressure, and whether someone smokes.

"If you have a CT calcium score of 0, then you may not need another test for five years," says Dougal. "That could make it cheaper and easier than the current process."

However, if the test comes back higher than 0, then you will need to follow the existing process which usually involves an exercise stress electrocardiography test, incurring the cost of both tests.

The CAA suggests that you discuss with your doctor which process will be best for you.

"We will be looking at our cardiovascular risk protocols in more depth in the future," says Dougal. "However, this interim step should make the process easier for many applicants without affecting safety."
